

Registration: Randomized Controlled Trial of Cognitive Behavioral Therapy for Generalized Anxiety Disorder

ClinicalTrials.gov ID: NCT04000100

Brief Summary

This trial evaluates the efficacy of 12 weeks of cognitive behavioral therapy (CBT) compared to waitlist control for adults with generalized anxiety disorder (GAD). The primary hypothesis is that CBT will reduce anxiety symptoms by at least 30% compared to waitlist.

Study Design

- Type: Interventional (Randomized)

Primary Outcome

- Measure: GAD-7 Anxiety Scale

Secondary Outcomes

- Measure: PHQ-9 Depression Scale

Sample Size

- Planned enrollment: 200 participants

Eligibility Criteria

Inclusion

- Age 18-65 years

Exclusion

- Current suicidal ideation (PHQ-9 item 9 $\geq$ 2)

Analysis Plan

Primary analysis: ANCOVA with post-treatment GAD-7 as dependent variable, controlling for baseline GAD-7, age, gender, and medication status. Multiple comparison correction: Bonferroni for secondary outcomes. Software: R 4.3.0.
